Model Description

What is the problem we are trying to solve? How do we think we will do it?

In our case, the problem we are trying to solve is the presentation, attractiveness, and at the same time, the display of information on the historical and cultural aspects of Nevada as a community through an interactive exhibition for the Museum of Arts.

The main idea is to use the human senses, specifically the auditory, with the help of speakers or headphones. By creating this, the person enters an immersive environment, where the audience can interact with the screen and choose some paintings belonging to a collection we selected beforehand. All selected paintings from the collection will have sounds related to them, making the experience feel more vivid and real.

The chosen collection is *Art of the Greater West*. We decided on this collection because of its historical context of the West, exhibited through fine art. Knowing the story of the *Art of the Greater West*, and keeping in mind what the client wants, we determined that there is a connection between this specific collection and the environmental problem we want to mitigate, this being the situation caused by the extraction of lithium and the effects it has on Nevada's common flora and fauna. The main purpose of our project as a team is orientation, and by stimulating the common human senses, we could attract people to be informed about this issue.

Parts of our prototype:

- **Pentagonal/Hexagonal-shaped capsule:** it is the place where the visitors come and interact with the selected paintings from the collection.
- **Black screens:** represent where the paintings could be located. The visitors can approach them and interact with them via speakers or headphones to hear the sounds.
- **The interior design of the capsule:** made to represent the holographic capacities of the capsule.

Model Description

What is the problem we are trying to solve? How do we think we will do it?

We are trying to solve the problem of limited attention spans when it comes to viewing artwork, and how people generally tend to look at a piece of art for only around 7 seconds before moving on.

We think we can solve the problem by stimulating many of a person's senses to make them fully immersed in the artwork. We plan on displaying five pieces from the *Altered Landscapes* collection that progressively show the deterioration of the Nevada landscape as caused by lithium mining. This will visually evoke emotion and understanding of the environmental issue in the viewer. We had the idea to have the viewer hold a physical object, either a flower to

represent nature or a hammer to represent construction and mining. They would then press that object into a button/sensor corresponding to one of the five paintings that would play a specific audio and release a specific scent associated with that stage of landscape development. Our hope is that the person feels as though they are physically part of the story due to the fact that they are physically interacting with the artwork and causing certain sounds and smells to be evoked. This would make them feel more emotionally invested in the artwork and cause them to interact with it for longer. Another option for further innovation is to connect this actuation to a pair of headphones the visitor wears, changing the soundscape based on where they are in the exhibit.

Parts of our prototype:

- **Five collections of artwork displaying progressively deteriorating Nevada landscape:** We will choose artwork representing five progressive stages of landscape deterioration in Nevada to highlight the environmental degradation caused by lithium mining.
- **Console/pedestal with five sensors:** Each of the five (donut-shaped in the prototype) sensors will send a signal to play audio from surrounding speakers and release a scent associated with the corresponding stage of landscape deterioration.
- **Scent module:** The scent module located under the pedestal will release a certain scent depending on which sensor the user is interacting with.
- **Handheld flower/hammer:** The user will have a handheld item that they will use to trigger sensors associated with each stage of landscape development on the pedestal.
