

Option 1:

Visitors of art museums, including the Nevada Museum of Art, spend an average of seven seconds looking at a piece of art. This short attention span means viewers are not engaging thoughtfully with the museum's pieces. To foster a deeper understanding of the museum's pieces, we will create interactive pedestals that stimulate the user's sight, smell, and touch.

Our initial approach involves the user holding a certain item to trigger scent and audio stimuli.

Option 2:

The Nevada Museum of Art has many impactful pieces in their collection, but visitors are not spending time thinking critically about these pieces. Furthermore, the presence of loud, distracting, or maximalist additions to their gallery that are typically engaging would not align with the curator's vision of the museum. To encourage critical thinking and time spent engaging with art pieces without disrupting the curated environment, we will create interactive pedestals that trigger olfactory and auditory stimulus with viewer engagement.

Our initial approach will involve manual actuation from the viewer, such as pressing a button to trigger mechanisms. This button will trigger a scent diffuser and wired headphones that the viewer has the option to wear. An alternative approach would be using RFID triggering and connecting to wireless headphones through bluetooth, wifi, LoRa, etc.

Option 3:

Our initial approach consists of creating an immersive experience with selected art pieces of collections such as *Altered Landscape* and the *Art of the Greater West*. The first collection reflects the actual situation we are trying to mitigate and create awareness about human activity in natural environments like lithium mining. Yet, the *Art of the Greater West* shows some of the pieces of art created by native americans themselves, bringing attention to the audience of important details that reflect Nevada's history. With the use of speakers and interactive screens on the paintings, triggering common human senses, we see the potential of captivating the audience's attention for more than seven seconds.

Option 4:

Creating an immersive experience to increase the attention for viewers at the Museum of Art in Nevada, the museum faces challenges in attracting and engaging an audience at least by 7 seconds. To assist in resolving this problem we selected two art pieces from the collection, *Art of the Greater West*, and *Altered Landscapes* in creating an immersive approach to gain the audience's attention by at least 7 seconds. In creating an environment that speaks with the

audience through short stories with sound and smell, from the history of these art pieces that speak.

Combo:

The Nevada Museum of Art has many impactful pieces in their collection, but visitors are not spending time thinking critically about these pieces. For example, the *Art of the Greater West* shows some of the pieces of art created by native americans themselves, bringing attention to the audience of important details that reflect Nevada's history, but this message requires critical thought to grasp. To encourage critical thinking and time spent engaging with art pieces without disrupting the curated environment, we will create interactive pedestals that trigger olfactory and auditory stimulus with viewer engagement.

Our initial approach will involve manual actuation from the viewer, such as pressing a button to trigger mechanisms. This button will trigger a scent diffuser and wired headphones that the viewer has the option to wear. An alternative approach would be using RFID triggering and connecting to wireless headphones through bluetooth, wifi, LoRa, etc. With these stimuli, we see the potential of captivating the audience's attention for more than seven seconds.

Mini Statements:

How can we maximize museumgoer attention span and engagement with X exhibit/Y art piece?

How can we create an impactful message behind the art pieces?

How can we get museum visitors to think critically about the art they're looking at?

How can we passively increase artistic engagement?

What keeps people from thinking about art deeply or engaging with it and how do we eliminate those barriers?

What's the minimalist route to maximize deeper thought in museumgoers?
